. What does a neuron compute?		1/1점
A neuron computes the mean of all feature function	es before applying the output to an activation	
A neuron computes an activation function	followed by a linear function $z={\it W}x+b$	
 A neuron computes a linear function $z = V$ 	$ar{W}x+b$ followed by an activation function	
A neuron computes a function g that scale:	s the input x linearly (Wx + b)	
∠ 7 더보기		
⊘ 맞습니다		
Correct, we generally say that the output (sigmoid, tanh, ReLU,).	of a neuron is $a = g(Wx + b)$ where g is the activation function	
. Which of these is the "Logistic Loss"?		1/1점
		7,70
$\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} - \hat{y}^{(i)})$	(1) 1 (2 (1))	
$ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 - y^{(i)}) + (1 - y^{(i)}) $ $ \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = y^{(i)} - \hat{y}^{(i)} $	$f^{(\phi)}\log(1-y^{(\phi)})$	
$\bigcirc \ \ \mathcal{L}^{(i)}(\hat{y}^{(i)},y^{(i)}) = \mid y^{(i)} - \hat{y}^{(i)}\mid^2$

	or) is copied 3 times so that it can be summed to each column of	

b = np.random.randn(3,3)*b.shape = (3,3)	
c = a * b	
What will be the shape of c?	
The computation cannot happen because the sizes don't match.	
c.shape = (3, 3)	
c.shape = (1, 3)	
The computation cannot happen because it is not possible to broadcast more than one dimension.	
√² 터보기	
	
Yes. Broadcasting allows row a to be multiplied element-wise with each row of b to from c.	
	1/
Suppose you have n_x input features per example. If we decide to use row vectors \mathbf{x}_j for the features and	1/
$[\mathbf{x}_1]$	
$X = \left egin{array}{c} \mathbf{x}_2 \ dots \end{array} ight .$	
$\begin{bmatrix} \vdots \\ \mathbf{x}_m \end{bmatrix}$	
What is the dimension of X ?	
$\bigcap (p, p)$	
(n _x , n _x) SS(1, n _x x)SS	
Loading [Mathlax/jax/output/CommonHTML/jax.js	
√² 터보기	
♥ 맞습니다	
Yes. Each \mathbf{x}_j has dimension $1 imes n_x, X$ is built stacking all rows together into a $m imes n_x$ array.	
a=np.array([[2,1],[1,3]]) What is the result of $a*a$?

Consider the following code snippet: a.shape = (3, 4) b.shape = (4, 1) for i in range(3): for j in range(4): c[i][j] = a[i][j]*b[j] How do you vectorize this? ○ c = a*b ○ c = np.dot(a.b) ○ c = a.T*b	

9. Consider the following code:

a=np.random.randn(3,3)

b=np.random.randn(3,1)

c = a * b

What will be \it{c} ? (If you're not sure, feel free to run this in python to find out).

- It will lead to an error since you cannot use **" to operate on these two matrices. You need to instead use np.dot(a,b)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, cshape = (3.1).
- O This will invoke broadcasting, so b is copied three times to become (3, 3), and $_{\star}$ invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- ⑥ This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so c.shape will be (3, 3)

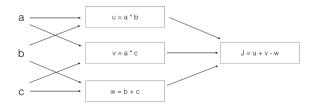

∠ 전보기

⊘ 맞습니다

10. Consider the following computation graph.

1/1점

1/1점

What is the output J?

- $\bigcirc \quad J = a*b+b*c+a*c$
- $\bigcirc \hspace{-.7cm} \quad J=(a-1)*(b+c)$
- $\bigcirc \quad J = (c-1)*(b+a)$
- $\bigcirc \quad J = (b-1)*(c+a)$

∠ 전보기

 \bigcirc 契金니다 Yes. J=u+v-w=a*b+a*c-(b+c)=a*(b+c)-(b+c)=(a-1)*(b+c).
